COVID-19 and Hand Hygiene

In the context of COVID-19, proper hand hygiene is crucial for maintaining good health. Hand hygiene should be practiced regularly and correctly to prevent the spread of the virus.

Hand sanitizer and soap should be used frequently, especially after touching surfaces or before eating. It is important to wash hands with soap and water for at least 20 seconds.

Disinfectants are also important in controlling the spread of COVID-19. Disinfectants should be used according to the manufacturer's instructions and should be used on surfaces that are touched frequently.

For more information, please visit the CDC website or the EPA website.
The Centers for Disease Control and Prevention (CDC) released asdale of recommendations for preparing for COVID-19, including guidelines for cleaning and disinfecting surfaces. These guidelines are based on the best available science and expert consensus of national and international public health experts. The CDC recommends using EPA-registered disinfectants that are effective against SARS-CoV-2. The CDC also advises that surfaces should be cleaned regularly and that disinfectants should be used according to the product label's instructions. 

For more information, please visit the CDC website at: https://www.cdc.gov/coronavirus/2019-ncov/prevent-getting-sick/how-covid-spreads.html

The American Academy of Pediatrics (AAP) has also released guidelines for managing children's healthcare during the COVID-19 pandemic. The AAP recommends that healthcare providers continue to follow the CDC's guidance for preventing the spread of COVID-19. The AAP also advises that children with COVID-19 should be isolated from others and that close contacts should be tested and monitored for symptoms.
